(b) The grant by a government to the author of a new and useful invention, or to his assigns, of the exclusive right of exploiting that invention for a specified term of years; also, the instrument of letters by which a grant of land is made by a government to a person or corporation. By the United States Revised Statutes, sec. 4882, etc., any person, whether a citizen or an alien, may obtain patent protection for the term of seventeen years "who has invented or discovered any new and useful art, machine, manufacture, or composition of matter, or any new and useful improvement thereof, not known or used by others in this country, and not patented or described in any printed publication in this or any foreign country, before his invention or discovery thereof, and not in public use or on sale for more than two years prior to his application, unless the same is proved to have been abandoned." The fact that the invention has been first patented in a foreign country will not deprive the inventor from obtaining a valid patent in the United States, unless the same has been here "introduced into public use for more than two years prior to the application." But the patent will expire with that foreign patent having the shortest term. In the application of the several clauses of this statute, distinctions arise of difficult and delicate character, which are the constant subject of controversy. patina (pā'tin-ā), *n.* [*L. patina*, *patena*, a broad shallow dish, a pan; see *paten*, *pan*.] 1. A bowl; a patella.—2. (a) An incrustation which forms on bronze after a certain amount of exposure to the weather, or after burial beneath the ground. It is, when perfectly developed, of a dark-green color, and has nearly the composition of the mineral malachite (hydrated carbonate of copper). Such an incrustation, although very thin, is considered to add greatly to the beauty of an antique object, especially of a bust or statue, and is of importance as protecting it from further oxidation. Artificial and evanescent patinas are produced by forgers of antiquities by the application of heat or of acids, and in various other ways. Some modern bronzes acquire a dark colored patina, which is a disfigurement rather than an ornament. Elaborate investigation on the part of various chemists has failed to explain this ill-colored patina very satisfactorily. It is believed, however, that coal-smoke in large cities may be the cause of its formation, as under such circumstances it contains particles of carbonaceous matter; and, also, that the present almost universal practice of putting consider-able zinc into the bronze, to facilitate its casting, is one of the causes of this defect. The dark color of the patina of Japanese bronze has been shown, in a considerable number of cases at least, to be in all probability due to the presence of lead in the alloy. Also *patina*. (b) By extension, the surface-texture or -color which other works of decorative art, as a wooden cabinet or the like, gain through the action of time. Hence—2. In the early church, and in the Orthodox Greek and other Oriental churches, a bishop of the highest rank; in the Roman Catholic Church, a bishop of the highest rank next after the Pope. In the early church the highest dignity, which came in time to be designated as that of *patriarch*, belonged from time immemorial, and was believed from apostolic days, to the bishops of Rome, Alexandria, and Antioch. These three sees ranking in dignity, precedence, and privileges in the order named. The Council of Constantinople (A. D. 381) gave the bishop of that see prerogatives of rank next after Rome, and the Council of Chalcedon (451) confirmed this, decreeing that this canon conferred an equality of prerogatives with Rome, still leaving the latter see, however, a higher rank. Since that time Constantinople has always stood at the head of the Orthodox Oriental sees, and since the sixth century its bishop has borne the title of *ecumenical patriarch*. The patriarchal dignity of Jerusalem was not recognized till the Council of Chalcedon. Constantinople, Alexandria, Antioch, and Jerusalem still remain the four great patriarchates of the Orthodox Eastern Church. In 1582 Moscow was made a patriarchate, ranking next after these, but since 1721 the place of patriarch of Moscow has been represented by the Holy Governing Synod. Besides the Orthodox Oriental patriarchs, there are others, representing the Armenian, Jacobite, Coptic, and other Oriental churches and also Latin or Roman Catholic titular patriarchs of the same name. In the Roman Catholic Church the Pope is regarded as having in his papal capacity a rank superior to his rank as patriarch, and the cardinals also take precedence of patriarchs. There are also three minor patriarchs in the Roman Catholic Church—of the Indies, of Lisbon and of Venice. The title of *patriarch* seems to have first come into use in the Christian church in imitation of a similar title given to the head of a Jewish *patria*, or group of communities. In general usage it was apparently first given, without definite limitation, to senior bishops or bishops of special eminence. The bishops of the great patriarchal sees were at first called *archbishops* (in the older sense of that title). From the fourth century the title of *patriarch* came to be

commonly applied to the bishops of the patriarchal sees, and is so used in Imperial laws of the sixth century. It was not, however, till the ninth century that it became strictly limited to these. *Emarcha*, metropolitane, and archbishops rank next after patriarchs. See *ecclesiast.*

The Primate of all England was also *Patriarch* of all the British Islands. *E. A. Freeman, Norman Conquest*, V, 133.

In correctness of speech, we are assured by Theodore Balsamon, the *Patriarch* of Antioch in the only Prelate who has a claim to that title—the proper appellation of the Bishops of Rome and Alexandria being *Pope*; of Constantinople and Jerusalem, *Archbishop*.

J. M. Neale, Eastern Church, I, 133.

10. In *gun-making*, the distribution of shot in a target at which a shot-gun is fired. In a circle called the "killing-circle" by sportsmen and gun-makers (which at a range of 40 yards is from 30 to 30 inches in diameter), the shot should be evenly distributed, so that there can be no possibility of escape for game within the periphery of this circle. The more uniform the distribution of the shot the better is the pattern. The number of shot in the pattern varies widely, according to the size of the shot, which is selected in accordance with the kind of game sought. To secure the desired pattern it is sometimes necessary to re-bore the barrel of a gun several times. — *Dambrod, frill, hawthorn, onion, pomegranate, etc., pattern*. See the qualifying words. — *Declared pattern*, the number of pellets of a given size, which, with a given weight of the shot and a given weight of a specified kind of powder, a shot-gun is stated by the maker to be able to deliver and distribute in a "killing-circle" of a stated diameter at a prescribed range, and with a good degree of uniformity in the distribution. Hence — (b) A number of such pieces of cardboard, forming a sort of book, or folder, alternatingly so as to open out in a long strip and exhibit, at one time, a number of patterns of stuff. — 2. In *weaving*, one of the perforated pieces of cardboard used in the Jacquard attachment to a loom. The cards are joined together in a flexible endless chain, and pass over the pattern-box each in turn controlling the harness system. Whenever a hole in a card and one in the box coincide, the corresponding rod connected with a warp-thread enters the hole and its warp-thread is raised. See *loom*.

Each of the Pattern-cards has a series of holes, each of which, when raised, causes a warp-thread to enter the hole and its warp-thread is raised.

Each of the Pattern-cards has a series of holes, each of which, when raised, causes a warp-thread to enter the hole and its warp-thread is raised.

pattern-chain (pat'érn-chân), *n.* In *weaving*, a device for automatically bringing the shuttles to the picker, according to the sequence required by the pattern. In one form, in the shuttle-boxes at the ends of the race, the links of the chain

pattern-maker (pat'érn-má'kér), *n.* In *weaving*, a workman who makes the patterns used by molders in foundry-work. These patterns are usually made, in the first instance, of pine or mahogany, the pattern-maker working from drawings. If the patterns are to be much used, they are frequently duplicated in metal, the pattern after casting being filed and smoothed, then warmed, and coated with wax. Metal patterns have the advantage of not warping like wood patterns. Patterns are also sometimes made of plaster of Paris swept by templates while in a plastic state. This method has been successfully applied in architectural ironwork in the production of cornices and analogous forms. Pattern-making is a distinct trade, requiring great skill in wood-working, combining as it does the finest joinery-work with the art of wood-carving and the ability to read and interpret the most complicated mechanical drawings.

pattern-molder (pat'érn-môl'dér), *n.* One who makes molds for iron castings. See *Simmonds*.

pattern-reader (pat'érn-ré'dér), *n.* One who arranges textile patterns. See *Simmonds*.

The characteristic feature of the coat of arms of the Medici family in Lombardy was a group of balls, or disks, variously characterized in different accounts (perhaps representing different branches of the family) as six red balls, three gold balls or blue balls, and three coins, and variously explained as representing pills, by way of play upon the family name, or as representing the money of bankers, the coins being indicated by spheres so as to present a circle in whichever direction looked at. It seems to have been from this armorial bearing that three golden balls hung in a cluster and three blue balls painted on a white ground were early adopted as the sign of money-lenders, corresponding to the existing emblem of pawnbrokers.

It is not generally known that the three Blue Balls at the *Pawn brokers* shops are the ancient arms of Lombardy. The Lombards were the first money-brokers in Europe.

Application of payments, appropriation of payments, the determining which of several obligations shall be extinguished or reduced, when a payment not sufficient to extinguish all is made. Thus, if a debtor owing to the same creditor an open account, a bond, and a note secured by mortgage on the debtor's property, pays a sum sufficient to satisfy only one, it is for his interest that it be applied to the mortgage, so as to free his property from incumbrance; and it is for his creditor's interest that it be applied to the open account, which is unsecured, and will be outlawed before the bond. The right of application rests with the debtor at the time of paying. If he does not exercise it, it passes to the creditor. If neither debtor nor creditor exercises the right, the court, if controversy arises, makes the application on equitable principles.—**Equation of payments.** See *equation*.—**Payment into court**, the deposit in due form with an officer of the court of a sum sued for, or of as much as is admitted to be due, for the benefit of the plaintiff if he will accept it.

pea (pé), *n.* (A mod. form, assumed as sing. of the supposed plural *peas*—see *peas*.) The plural of *pea* is *peas*, as 'as like as two peas'; 'a bushel of peas,' with ref. to the individual seeds, as in 'a bushel of beans'; but when used collectively the old singular *pease* is properly used, as 'a bushel of *pease*,' like 'a bushel of wheat or corn.' 1. The seed of an annual hardy leguminous vine, *Pisum sativum*; also, the vine itself. The pea is marked by its climbing habit and glaucous surface. Its plant has ending in a branching tendril, its large stipules, and its large, commonly white, papilionaceous flowers, followed by podulose pods containing sweet nutritious seeds. The original form, *P. sativum*, var. *arvense* (*P. arvense*), the common gray pea or field pea, is thought by some to be native in Greece and the Levant, by others to have come from further north. Peas were known to the ancient Greeks and Romans, and their cultivation is now general. Usually only the seeds are edible, but the pods of the sugar pea, skilions pea, or string pea are eaten, as in the case of "string beans." The seeds are now mostly consumed when green, but are also split when ripe, and used in soups or ground into meal. (See *peas-meal*.) Before the spread of the potato, peas formed in England a principal food of the working classes. The varieties are very numerous, those of the marrow class being distinguished by seeds which are wrinkled and greenish even when ripe.

peach-yellow (pé'ch-yel'ow), *n.* A peculiar and very destructive disease affecting the cultivated peach-tree. It is entirely confined at present to the orchards of the eastern United States, where it annually causes the death of many thousands of trees. The leaves become dwarfed, distorted, and "scorched" in appearance, the twigs pale and dwarfed, and the fruit red-spotted and prematurely ripe. In the first year the disease usually causes only a more or less premature ripening of the fruit, in the second year it is more marked, the whole tree having a sickly languishing appearance, with the entire foliage dwarfed and rolled up, and yellowish or brownish red (whence the name) in color. The diseased tree rarely dies in the second year of attack, and rarely lives beyond the fourth or fifth year. Little or no valuable fruit is produced after the second year. The cause of the disease is at present unknown, but from the investigations that are now being carried on it seems very probable that it is a bacterium. See *yellow*.

Peafowl (Pavo cristatus).

largest of the gallinaceous birds, and in full dress is the most magnificent of all birds. The gorgeous train which constitutes its chief ornament is often four feet long, and consists of an extraordinary mass of upper tail-coverts, set tail-feathers, which latter the train overlaps and far out-reaches. These tail-coverts are elegantly formed of spray-like decussated webs enlarged and recomposed at the end, and marked with glittering ocelli or "eyes." This whole mass of plumage is capable of being erected

and spread in a vertical disk completing a semicircle, or more, of the most brilliant iridescent colors, chiefly green and gold. The tail-feathers proper and the primaries are chestnut; the neck and breast are blue of a peculiarly rich tint called *peacock-blue*. The head is crested with a bunch of about twenty four upright plumes. The length proper is about four feet, the train, when fully developed, measuring from two to four feet more. The peahen is much smaller and more plainly feathered, without the train. The peacock was sacred, among the Greeks and Romans, to Hera or Juno, but is now commonly regarded as the symbol of valingory and as a bird of ill omen. The flesh is edible, like that of other gallinaceous birds. The cry is extremely loud and harsh. See *Pavo*, *peahen*; also cut under *ocellate*.

peag, peak (pég, pék), *n.* [Amer. Ind.] Among the North American Indians, in colonial days, a sort of money consisting of beads made from the ends of shells, rubbed down and polished and strung into belts or necklaces, which were valued according to their length and the perfection of their workmanship. Black or purple *peag* was worth twice as much as white, length for length.

Peak is of two sorts, or rather of two colors, for both are made of one shell, though of different parts: one is a dark purple cylinder, and the other a white; they are both made in size and figure alike, and commonly much resembling the English bugles, but not so transparent nor so brittle.
Beverly, *Virginia*, iii. § 40.

pearl (pə:rl, n. [*C.M.E. perle* (the alleged A.S. *pearl, *perl, a pearl), rents on a dubious gloss

"*enula, pearl*," where *enula* is uncertain); = D. *parel, pearl, perle*; = M.G. *parle, perle, perlin*; = O.H.G. *perula, peralt, perla, herala, berla*, M.H.G. *berle, G. perle*; = Ital. *perla*; = Sw. *perla*; = Dan. *perle*; = OF. *perle, pelle, F. perle*; = Fr. *perle*; = Pg. *perola, perla*; = It. *perla*; < early M.L. *perula, perulus, perla*, a pearl, prob. var. of *perula*, a little pear, dim. of *perum*, a pear; see *pearl*. Cf. Sp. *perilla*, a little pear, a pear-shaped ornament, O.H. *perolo*, a little button or tassel (Florio). Cf. *parl*.] 1. A nacreous concretion, or separate mass of nacre, of hard, smooth, lustrous texture, and a rounded, oval, pear-shaped, or irregular figure, secreted within the shells of various bivalve mollusks as a result of the irritation caused by the presence of some foreign body, as a grain of sand, within the mantle-lobe. The formation of a pearl is an abnormal or morbid process, comparable to that by which any foreign body, as a bullet, may become encysted in animal tissue, and so cause further irritation. In the case of the mollusks which yield pearls, the deposition is of the same substance as the nacre which lines the shell, hence called *mother-of-pearl*, in successive layers upon the offending particle. Fine pearls have frequently been found in working the mother-of-pearl shell. Chemically, pearls consist of calcium carbonate interstratified with animal substance, and are hence easily dissolved by acids or destroyed by heat. The chief sources of the supply of pearls are the pearl-oysters and pearl-mussels, *Aequidula* and *Unio*, and foremost among the former is the pearl oyster of Indian seas, *Margarita margaritifera*. Pearls are generally of a satiny, silvery, or bluish-white color, but also pink, copper-colored, purple, yellow, gray, smoky brown, and black. The finest white pearls are from Ceylon, the Persian Gulf, Thursday Island, and the western coast of Australia. The yellow are from Panama. The finest black and gray pearls are obtained in the Gulf of California, along the entire coast from Lower California to the lower part of Mexico. There are two distinct varieties of pink pearl: those from the common conch shell, *Strombus gigas*, of the West Indies, and those from the union or fresh mussels found in Scotland, Germany, France, and the United States (the finest being obtained principally from Ohio, Tennessee, Kentucky, Texas, and Wisconsin), also from the small marine shell *Trigona pectunculata* of Australia. Purple, light-blue, and black pearls are found in the common clam, *Venus mercenaria*. The yellow color of Oriental pearls generally results from the decomposition of the mollusks in which they are found. The value of a pearl depends entirely on its perfection of form (which must be either round, pear-shaped, or a perfect oval), on its luster or "orient," and on the purity of its color, a tint of yellow or gray detracting very much from the value. Pearls are sold by the pearl-grain, four grains equaling one carat. (See *carat*, n., 4.) From 1880 to 1885 the demand for pearls and the rarity of their occurrence resulted in an advance in price of from 250 to 300 percent., the larger pearls having advanced more, proportionally, than the smaller ones. Until about 1885, pearls were generally valued as multiples of a grain. The value of a pearl larger than one grain was estimated by squaring its weight and multiplying this by the value of a one-grain pearl; thus, a two-grain and a five-grain pearl were worth respectively 4 and 25 times the value of a one-grain pearl.

Eng.]—11. *Eccl.*, a name sometimes given to a particle of the consecrated wafer: still current in the Oriental Church.—12. A name given by gilders and manufacturers of jewelry to granules of metal produced by melting it to extreme fluidity, and then pouring it into cold water. The stream in pouring should be so small, and the crucible held at such a distance from the water, that the metal will break up into fine drops (pearls) before reaching the water, which instantly cools them. The cooled granules are usually pear-shaped. The epithet *granulated* is more commonly applied in the United States to metals prepared in this way, as granulated copper, silver, zinc, etc., used in the preparation of jewelry alloys on account of their convenience in weighing, and for other purposes. Pure granulated zinc being much employed by chemists for generating pure hydrogen gas, as in Marsh's test for arsenic, etc.

13. In *lace- and ribbon-making*, one of the loops which form the outer edge. Also *part*.—14. In *decorative art*. See *part*. **Baroque pearl.** See *baroque*. **Blind pearls.** Irregular, lusterless, and valueless pearls, used for medicinal purposes in the East. **Epithelial pearls.** Small spheroidal masses of flattened epithelial scales, concentrically arranged, occurring in epitheliomas. Also called *bird's-nest bodies* and *epidermic spherules*. **Half pearls.** Pieces cut from pearls that are very irregular and have only one lustrous side or corner, which is slit off. They are extensively used in jewelry, and are much less expensive than whole pearls, but are very liable to become discolored if wet, as the layers of the pearl, being cut at an angle, absorb the water, and any impurities it may contain show through the layers. **Imitation, artificial, or false pearls** are of two kinds, *solid* or *massive pearls* and *blown pearls*. (See *Lemaire pearl* and *Roman pearl*.) The first are known as *Venetian pearls*, and are manufactured chiefly on the island of Murano, near Venice. They are made from small white or colored glass tubes, the desired hues being produced by the use of oxides of tin and other metals. Blown pearls consist of small globules of thin glass, coated on the inside with the so-called oriental pearl essence, or essence of orient. Their manufacture is attributed to Janin or Jaquin, who lived in Paris about 1600, and who was the first to blow hollow glass balls with this mixture, which he prepared with the scales of a small fish, the bleak, common in France and Germany, and mullage. The mixture was first suggested by his observing the pearly luster of the scales that were detached from the fish when they rubbed against one another in a trough. The scales of *lyon* fish are required to make one pound of oriental pearl essence.—**Inner pearl.** In *lace making*, ornamental loops worked around the edge of an opening in lace, as distinguished from *pearl*, which is a loop on the outer edge. **Large pearl.** In *confectionery*, the condition of clarified sugar-syrup when it has been boiled to such a consistency that, when a drop is taken between the finger and thumb, these may be separated to the greatest extent without breaking the connecting thread of syrup. In this condition the sugar forms a large drop, or "pearl," if suspended from a rod. **Lemaire pearl.** an imitation pearl composed of a solid glass ball externally coated with a varnish composed of oriental pearl essence, white wax, alabaster, and pulverized gum. **A Cadellian Gem.** **Little pearl.** In *confectionery*, the condition of clarified sugar-syrup when it has been boiled to such a consistency that, when a drop is taken between the finger and thumb, the finger and thumb may be separated to nearly the full extent without breaking the thread of syrup. Large quantities are used in the East for medicinal purposes, in the composition of electuaries supposed to possess stimulating and restorative qualities.—**Small pearl.** Same as *little pearl*.—**Smoked pearl.** mother-of-pearl having black or very dark veins or cloudings.—**Virgin pearls.** unperfected pearls of fine quality.

A peasant may or may not be the proprietor of the land which he cultivates; in Great Britain he is distinguished from a *farmer* as having less property, education, or culture, or inferior social position, but the word is very vague. The French peasant (*peysan*) and the German peasant (*bauer*) were until recently greatly restricted in their civil and political rights. The word is not used in the United States, where there is no comparatively stable body of agricultural laborers corresponding to the European peasantry.

And the nests in mynys where they went on loads they

peat (*pēt*), *n.* [*ME. "pete" (ML. AL. petra)*,
peat. Cf. *beast*, mod. < *beet*, *v.*, mend (a fire,
etc.). Cf. *purse*, var. of *hurse*.] 1. Partly de-
composed vegetable matter, produced under
various conditions of climate and topography,
and of considerable importance in certain re-
gions as fuel. Peat occurs in many countries and in
different latitudes, but always either in swampy local-
ities or in damp and foggy regions. It is formed of vege-
table matter undergoing decay, and in some respects it is
the modern representative of the coal of Mesozoic geolo-
gical epochs, and its formation illustrates the conditions
under which coal has originated. Peat is abundant in
northern Europe, and particularly so in Ireland, where it
is perhaps of greater importance as fuel than in any other
country. It occurs in India, especially in the Nellore
hills and in Bengal, also in various parts of the United
States, and there are in the latter country regions re-
specially in New England where it is occasionally used as
fuel. The vegetation of which peat is made up in the
various countries where it occurs is quite different, and oc-
casionally the number of species which have taken part in
its formation is large. The genus *Sphagnum* is an im-
portant element in much of the European peat. The peat
of Bengal, on the other hand, is said to be formed almost
exclusively from one plant, the wild rice, *Oryza epetaria*.
The peat of New England is made up of a considerable
variety of aquatic plants. Peat is very spongy, and con-
tains a large amount of water near the surface; the deeper
down it is taken, the more compact it is. A great variety
of processes for compressing and hot-drying it have been
invented and put in use in different parts of the world.

2. A small block of peat-bog or -moss, resem-

peat-bog (*pēt*'bog), *n.* The common name in
the United States for those accumulations of
peat which are known by this name in Great
Britain, but also, and more generally (except
in Ireland), as *peat-mosses* and *peat-moors*.

peat-charcoal (*pēt*'chār'kōl), *n.* Charcoal made
by carbonizing peat. This is done in various ways,
as in piles, open kilns, pits, and ovens. Peat-charcoal has
been much experimented with, and used in metallurgical
operations to some extent for fully three hundred years.
The carbonization of ordinary air-dried peat produces a
very friable charcoal, and the denser the peat is made, by
compression or in other ways, the better the article pro-
duced.

In France *peat-charcoal*, under the name of *Charbon noir*,
is much used for making gunpowder. *Ibid.*, *ibid.*, III. 527.

peat-coal (*pēt*'kōl), *n.* A soft lignite, of earthy
character.

peat-machine (*pēt*'ma-shēn'), *n.* A machine,
similar in principle to the brick-machine, for
preparing peat for fuel, either without addition

or by admixture of other substances, as coal-
dust, tar, etc. These machines are, in general, pri-
mers and pressers, which pulp the material in order to ren-
der it homogeneous, and then compress it into blocks of
convenient form.

peat-moor (*pēt*'mōr), *n.* Same as *peat-moss*.
In the United States such deposits are called
swamps or *bogs*. See *peat* and *peat-moss*.

Peat is very largely dug in the moorlands of Somerset-
shire, near Edington and Shapwick, between Glastonbury
and Highbury. Some of these beds have been worked
for fuel from the time of the Romans, and probably earlier,
while others are of more recent formation. The peat moss
or "turbarry lands" have an irregular distribution; and
the peat, which in places is 14 or 15 feet thick, is due largely
to the growth of the common sedge (*Carex*), whence
Hedgewood derives its name.

Woodward, Geol. of England and Wales (2d ed.), p. 526.

peat-moss (*pēt*'mōs), *n.* 1. Moss entering into
the composition of or producing peat; moss
of the genus *Sphagnum*.—2. A peat-bog or
-swamp; a name frequently given in Great
Britain to those accumulations of peaty matter
which in the United States are commonly
known as *peat-bogs*.

Peat mosses cover many thousand square miles of Europe
and North America. About one seventh of Ireland is cov-
ered with bogs, that of Allen alone comprising 283,500
acres, with an average depth of 25 feet.

some culinary use; its leaves yield a blue dye. It is some-
times planted for ornament.

2. A shrub of the genus *Nesbania*. *A. (Agati)*
grandiflora, sometimes specified as *West Indian pea-tree*,
is an East Indian shrub naturalized in Florida and some
of the West Indies, having white or red flowers 2 or 4
inches long. *Swamp pea-tree*, the fuller name of plants
of this genus, is applied somewhat particularly to *N. cor-
dentata*.

peat-reek (*pēt*'rēk), *n.* The smoke of peat.—
Peat-reek flavor, a special flavor communicated to
whisky, which is distilled with peat used as fuel. This
flavor is frequently simulated by adding a little cresote to
the whisky. [Scottish.]

plant, generally the common pea.—2. Specifi-
cally—(a) A plant of the genus *Amphicarpea*.
See *hog-peanut*. [U. S.] (b) *Vicia Americana*, a
common species throughout the United States,
with from four to eight pairs of leaflets, and
purplish flowers a few in a cluster.

pea-weevil (*pē*'wē'vī), *n.* A kind of curculio,
Bruchus pisi, which infests peas. It is an indige-
nous North American insect, which probably fed on
some other legume before the cultivated
pea was introduced; it has spread to Europe, and is
now found in Great Britain and along
the Mediterranean.

The egg is laid on the outside of the
pod, and the newly
hatched larva bur-
rows into the nearest
pea, in which it
feeds and grows to
full size. Before
transforming to the
pupa it provides for
its exit by cutting a
round hole through
all but the outer
membrane of the
pea. The beetle does
not issue until the
following spring. See *Bruchus*. Also called *pea-beetle*,
pea-bug, and *pea-chaffer*.

(Origin unknown; hardly borrowed, as Skeat suggests, from L. *papula*, a pustule, *papilla*, a pustule, nipple (see *papula*, *papilla*). An Icel. **pippull*, a ball, is cited, but not found.] 1. A small rounded stone. The term is usually applied to stones worn and rounded by the action of water. Pebbles are in size than cobbles; and ordinary gravels are chiefly made up of sand, the grains of which pass by imperceptible gradations of size into pebbles, with which are frequently intermixed more or less of rounded fragments large enough to be called cobbles.

My fords with pebbles, clear as orient pearls, are strow'd.
Drayton, Polyolbion, xiv. 270.

See *Wedgwood*, *Wedgwood Handbooks*.—*Variagated pebbleware*, the name given by Josiah Wedgwood in 1770 to pebbleware presenting "colors and veins": it then seems to have been given to those veined or spotted wares which were not otherwise specially designated.

pebbling (peb'ling), *n.* [Verbal *n.* of *pebble, v.*] In *leather-manuf.*, a special kind of grain-ing, in which an artificially roughened or indented surface on the grain side of leather is produced by working upon that side with a roller having a pattern which is the reverse of the pattern to be impressed on the leather. The term is properly restricted to the act of producing an irregular pattern, such as would be produced by pressing irregularly distributed minute pebbles upon the leather; whence the name. A pattern consisting of straight or approximately straight lines is called a *straight grained pattern*, and the leather would be called *straight-grained*. The term *graining* includes pebbling, which is but a special kind of graining, of which glassing or glazing is still another variety.

pebbling-machine (peb'ling-ma-shón'), *n.* In *leather-manuf.*, a machine resembling a polishing-machine in its construction, used to perform the special work called pebbling. The pebbling is done by a roller having on its surface the pattern, in reverse, which it is desired to impart to the grain of the leather. The roller is pivoted to elastic bearings at the lower end of a swinging arm, and is antagonized by a table curved to correspond to the arc through which the roller acts. The leather is supported by the table while subjected to the action of the roller. The imparting of a pattern in imitation of more costly leather is strictly a variety of graining, though often called *pebbling*. Since the machine used for glassing, glazing or polishing is transformed into a pebbling-machine by a change in the roller only, the machine is variously and indifferently called *polishing*, *glassing*, *graining*, or *pebbling machine*.

pebbly (peb'li), *a.* [*< pebble + -y*.] Full of pebbles; abounding with small roundish stones.

Inside, the body is filled with minute oval corpuscles (*Microsporidies*), upon the presence and multiplication of which the disease depends. Pebrine is both contagious and infectious. The Pasteur system of selection consists in the microscopic examination of the moth after egg laying, and the rejection of eggs laid by those found to be diseased. The microbe which causes pebrine was named by Labret *Pantodophyton*, and classed among the *paraparasitica*.

pebrinous (peb'ri-us), *a.* [*< pebrine + -ous*.] Affected with pebrine.

Pecopterides (pé-kop'tér-id'és), *n. pl.* [*NL.*, < *Pecopteria* (-rid-) + *-es*.] A group of fossil ferns to which belongs the widely disseminated and highly important genus *Pecopteris*.

Schimper has grouped the *Pecopterides*, with regard to their relation to living ferns and with reference to the character of the fructification, in five subdivisions: but "one has only to look at the classification of a few species grouped from the apparent character of the fructifications to see how unreliable are the diagnoses derived from them" (*Leopold*). The grouping of the *Pecopterides* suggested by the fossil botanist of the Pennsylvania Geological Survey is as follows: (1) Including the species referred by Schimper to the genus *Pecopteris*, distinguished by an upward curve of the lateral veins; (2) *Pecopteris* proper, or *cymbella*, to which division belong the species answering exactly to Brongniart's definition of the genus *Pecopteris*; (3) *Pecopteris* with hairy or villous surfaces, a permanent and easily discernible character; (4) *Pecopteris* with pinnae not distinctly divided into obtuse entire lobes or pinnules, but generally cut on the borders in sharp irregular teeth; and (5) a group containing those species referred to *Pecopteris* which "do not find a place in the former divisions." Kidston (1885) divides the *Pecopterides* into two subdivisions, *Pecopteris* and *Desclieuxia*;

the genus *Pecopteris*, as limited by him including species previously referred by fossil botanists to twenty-four different genera.

Pecopteris (pé-kop'tér-is), *n.* [*NL.*, < *Gr.* *πέκος*, comb, + *τέρις*, a fern.] A genus of widely disseminated fossil ferns, occurring in large numbers in the coal-measures of Europe and America, and found also in the Middle Devonian of New Brunswick. About 20 species referred to this genus were described by Leopold, in 1885, as occurring in the coal-measures of the United States, chiefly in Pennsylvania and Illinois.

As described by Brongniart, the genus *Pecopteris* has bipinnate or tripinnate fronds; the pinnae are long and pinnatifid; the pinnules adhere to the rachis by the whole base, and are often more or less deeply connate and not decurrent, and the borders are generally contiguous or nearly so; the secondary veins, which are derived from the median nerve of the pinnules, are simple, bifurcate, or trifurcate. pedal (ped'al) or *pe'dal*, *a. and n.* [= *F. pédale, n. = It. pedale, < L. pedalis, pertaining to the foot, < pes (ped-), = F. foot; see foot*] 1. *a.* 1. Pertaining to or connected with a foot or the feet; as, *pedal extremities*.—2. Technically—*(a)* Of or pertaining to a foot-like part of the body, as of a mollusk; *pedial*; as, a *pedal ganglion*. *(b)* Of or pertaining to the power or hind foot only; opposed to *manual*.—3. Pertaining to the feet of perpendiculars let fall from one point upon tangents to a fixed focus called a *focus*.—4. *(ped'al)*. In *music*, relating to a pedal.

Pedal action, the entire mechanism of pedals in either a *planoforte*, *organ*, or *harp*, including the pedals themselves, the connecting apparatus of rods, levers, levers, etc., and their attachment to dampers, *drawers*, etc. **Pedal adductor**, the posterior adductor muscle of bivalve mollusks, the anterior one being distinguished as *pedal*. It is the only one in the *Musculum* system and scallop. **Pedal artery**, the dorsal artery of the foot. **Pedal base**, *see organ-point*. **Pedal board**, same as *pedal keyboard*. **Pedal check**, in *organ-building*, a device for preventing damage to a pedal keyboard when not in use. It consists of a bar which prevents the pedal keys from being depressed until it is moved. It is usually controlled by a stop-knob. **Pedal coupler**, in *organ-building*, a coupler which connects one of the manual keyboards with the pedal keyboard, so that the latter affects the former.

Usually each of the keyboards may be thus coupled to the pedal. **Pedal curve or surface**, the locus of the foot of the perpendiculars let fall from one point upon the tangents to another locus to which the former is *pedal*. **Pedal ganglia**, intra-cerebral ganglia in the nervous system of mollusks. *See* cut under *Lamellibranchia*. **Pedal harmony**, in *music*, same as *organ-point*. **Pedal harp**, *see harp*. **Pedal key**, in *organ-building*, the key-board or set of levers intended to be played by the feet. It consists of black and white keys like the manual keyboard, only on a larger scale. Its usual compass in modern organs is from the second C below middle C to the D or the F next above it. It is sometimes compassed, the extreme right and left levers being higher than those in the middle, or *radiating*, the front ends of the levers being nearer together than the back ends—both arrangements being intended to help the player to reach all the keys with equal ease. The pedal keyboard properly sounds the stops of the pedal organ; but it may also be coupled with either of the manual keyboards, and thus may simply extend the resources of the latter. Pedal keyboards are sometimes added to reed-organs, and even to pianofortes. *See* *pedalizer*, and *cut under organ*. **Pedal line**, a line through the feet of the three perpendiculars to the three sides of a triangle, let fall from any point on the circumference of the circumscribed circle. **Pedal muscle**, *(a)* In *human anat.*, same as *extensor digitorum pedis* (which *see* under *ped*). *(b)* In *conch.*: (1) Any muscle of the foot or podium of a univalve. (2) The posterior adductor of a bivalve, when there are two. *See* *cut* under *Adiantum* and *Tridacna*. **Pedal note**, either a note or a tone produced by a pedal key, or the same as *organ-point*. **Pedal organ**, in *organ-building*, that one of the partial organs which is played from a pedal keyboard. Its compass is usually about two or two and a half octaves. Its stops are the deepest and most sonorous in the instrument, usually of 16- or 32-foot tone.

Pedal origin, the fixed point from which the perpendiculars are let fall. **Pedal passage**, in *organ-building*, a passage or phrase intended to be performed on the pedal keyboard. **Pedal piano**, a pianoforte with a pedal keyboard or *pedalizer*. **Pedal pipe**, in *organ-building*, one of the pipes belonging to the pedal organ. **Pedal ratio**, *see* *cut*, 11. **Pedal rod**, in *organ-building*, a rod connecting a pedal with the mechanism for shortening the strings. **Pedal soundboard**, in *organ-building*, the soundboard of the pedal organ. **Pedal stop**, in *organ-building*, a stop or stop-knob belonging to the pedal organ. **Pedal vesicle**, one of the many little vesicles of the water-vascular system of an echinoderm which are connected with the water feet or tube-feet, and cause the latter to protrude when full of water. *See* *cut* at *Adiantum*.

II. *n.* (*ped'al*). 1. Any part of a machine or apparatus which is intended to receive and transmit power from the foot of the operator; a treadle; as, the *pedals* of a bicycle.—2. In musical instruments, a foot-lever; a metal or wooden key or projecting bar operated by the foot. *(a)* In the pianoforte two or three pedals are in use: one to lift the dampers from the strings (the *dampening pedal* or *loud pedal*); one to introduce a number between the hammers and the strings, or to lessen the distance from which the hammers strike, or to move them so that they shall strike only one string instead of the usual two or three (the *soft pedal*); and sometimes one to hold up the dampers that happen to be lifted when the pedal is pressed down (the *sustaining pedal*). The use of the damper pedal is indicated by *ped.* at the beginning of the passage where it is needed, and by a ' at its end. The use of the soft pedal is usually indicated by some such expression as *una corda*, 'one string'. The use of the sustaining pedal is usually left to the player's discretion. *(b)* In the pipe-organ several different kinds of pedals are used: those which form the pedal keyboard, and which are like the keys or digitalis for the hands, but much larger (*see* *pedal keyboard*, and *cut* under *organ*); those which control the drawing of one or more of the stops (*combination pedals*, *combination pedals*, *cracenda pedal*, *dissonance pedal*, *forwards pedal*, etc.); that which controls the opening of the blinds or shutters of the swell box (the *swell pedal*), etc. *See* the phrases below. *(c)* In the reed-organ and harmonium, one of the treadles by which the player operates the feeders of the bellows. *See* *reed-organ*. *(d)* In the harp, one of the foot levers whereby all or some of the strings may be temporarily shortened, and their pitch raised. In modern harps seven pedals are used, any one of which may be used in two ways, raising the pitch either one or two half-steps; every pedal affects only the strings of a particular letter-name. By combining the pedals in various ways the instrument may be set in any desired key (tonality). *See* *cut* under *harp*. *(e)* Collectively, same as either *pedal keyboard* or *pedal organ*.

3. Same as *organ-point*.—4. A pedal curve or surface, or one of which another in the pedal curve or surface. **Balanced pedal**. *See* *swell-pedal*. **Combination pedal**, in *organ-building*, a metal pedal which enables the player to control the use of several stops at once by his foot. Such pedals are placed above the pedal keyboard. They are either *angle* or *double-acting*—the former serving either to draw or to retire certain stops, the result depending upon the registration at the moment when the pedal is used, and the latter serving both to draw and to retire certain stops, so that the result is always the same whenever the pedal is used. **Combination pedals** are applied to the stops of all the keyboards, usually beginning with those of the great organ. They include a *forte pedal* (single-acting), which draws all the stops of the keyboard to which it belongs; a *mezzo pedal* (usually double-acting), which draws most of the important stops and a few stops of the keyboard; and a *piano pedal* (single-acting), which retires all but one or two of the lighter stops. **Combination pedals** do not always affect the stop-knobs; if not, they are so made as to be hooked down when in use, and when they are released the combination made by the stop-knobs remains unchanged. **Combination pedals** of all the above varieties often control also certain of the stops of the pedal organ, so that, when a given combination on the manuals is used,

appropriate pedal stops are also drawn.—**Composition pedal.** Same as *combination pedal*.—**Compler-pedal**, in *organ-building*, a pedal which controls one of the stopplers, usually that which unites the great and pedal organs.—**Crescendo pedal.** See *crescendo*.—**Diminishing pedal.** See *crescendo*.—**Double-acting pedal.** See *combination pedal*.—**Extension pedal.** Same as either *diminishing pedal* or *sustaining pedal*.—**See def. 2 (a).**—**First negative pedal**, the locus to which the basis locus is the pedal.—**First pedal**, the pedal curve or surface.—**Forse pedal.** See *combination pedal*.—**Harp pedal.** Same as *soft pedal*.—**Inner pedal.** See *inner*.—**Loud pedal.** See *def. 2 (a)*.—**Messo pedal.** See *combination pedal*.—**Oblique pedal**, a plane curve the locus of intersections under a constant angle of lines through a fixed point with tangents to a fixed curve.—**Open pedal.** Same as *loud pedal*.—**Piano pedal.** See *combination pedal*.—**Ratchet pedal.** See *well pedal*.—**Rat-trap pedal**, a kind of foot-piece used on some bicycles and velocipedes, consisting of a flat iron or steel bar bent into oblong rectangular form, and having its meeting ends welded together. The pedal-pivot passes midwise from end to end of the pedal, through holes made in the ends; and the upper edges of the longer parallel sides are serrated. The whole thus much resembles a small steel trap with open jaws, as when set for catching rats, etc., whence the name.—**Reversible pedal.** See *compler pedal*.—**Second pedal**, the pedal of the pedal.—**Sforzando pedal**, in *organ-building*, a pedal which suddenly and temporarily brings the entire power of the instrument into use, so that a forcible accent can be produced.—**Single-acting pedal.** See *combination pedal*.—**Soft pedal.** See *def. 2 (a)*.—**Sustaining pedal.** See *def. 2 (a)*.—**Well pedal**, in *organ-building*, a pedal which opens the shutters or blinds of the swell box, and so increases the power of the tones produced by the pipes in it.—**Toe-and-heel pedal.** Same as *balanced pedal*.

It includes about 10 species, belonging to 12 genera and 4 tribes, natives of warmer regions everywhere, especially of Africa. *Martynia*, *Scamonea*, and *Pedaliem* (the type) are the best known. The only species, *P. Murex*, is a native of India and tropical Africa. It is a smooth annual herb, with musky odor, somewhat branching, with opposite or alternate broad and coarsely toothed leaves, and yellow flowers solitary in the axils. The only OF. term answering to this form is *piéd de grue*, crane's foot: *piéd*, *pie*, nom. also *pez*, < L. *pes* (*pid-*), foot; *de*, < L. *de*, of; *grue*, < L. *grus*, crane: see *foot* (and *pedal*, etc.), def. *Grue*, and *crane*. No record of the use of OF. *piéd de grue* in the sense of 'pedigree,' or in any relation thereto, has been found; if so used (and no other explanation of the ME. forms seems possible), it must have been a fanciful application, in restricted AF. use, perhaps in allusion to the branching lines of a pedigree as drawn out on paper (cf. *crane's-foot*, applied to the *limb* of age about the eyes). The crane was at the time in question very common in England and

France, and it figures in many similes, proverbs, and allusions. The term appears to be extant in the surname *Pettigrew*, *Pettigrew* (from the early mod. E. *pettigrew*, ME. *pettigrew*, etc.). For the form, and the use as a surname, cf. the modern surname *Pettifer*, *Pettifer*, < ME. *Pettifer*, *Pettifer*, < OF. *piet de fer*, 'iron foot.' Of the various other explanations of *pedigree*, as OF. *par degrés* (Minsheu), 'by degrees,' 'per degrees,' i. e. *descensus seu parentela maiorum* (Minsheu), lit. 'father-degrees,' 'petit degree' (actually so spelled in one instance in Stanishurst), or other suggestions involving *petty* or *degrees*, none is tenable. The mod. = Syn. *Pedigree*, *Genealogy*, *Lineage*. *Pedigree* may be used with reference either to a person or to an animal, as the *pedigree* of a horse; the others only to a person or family. In some cases it extends to genetic time, as, the *pedigree* of Cæsar's horse. *Genealogy* is the series of generations, coming down from the first known ancestor. *Lineage* views the person as coming in a line of descent, generally honorable, which, however, need not be traced, as in a *genealogy* or *pedigree*. *Pedigree* and *lineage* are generally much narrower words than *genealogy*, the last usually covering some personal history and including details of various matters of interest to the persons or families concerned.

They bear fleshy branches, with an acrid milky juice, alternate stem-leaves and opposite floral leaves, and flowers surrounded by greenish or colored involucre, arranged in terminal or axillary cymes. Several species are cultivated as evergreen shrubs in greenhouses, and from the shape of the involucre are known as *slipper-plants*. *P. bipinnaloides*, of the West Indies and South America, known as *pe-bush*, is used in medicine as an emetic.

In arch., a low triangular part resembling a gable, crowning the fronts of buildings in the Greek styles, especially over porticos. It is surrounded by a cornice, and its flat recessed field or tympanum is often ornamented with sculptures in relief or in the round. Among such sculptures are found the finest remains of Greek art, the pediment figures of the Parthenon, by Phidias. In the debased Roman and Renaissance styles the same name is given to gables similarly placed, even though not triangular in form, but semicircular, elliptical, or interrupted, and also to small flanking members of any of these shapes over doors or windows. In the architecture of the middle ages small gables and triangular decorations over openings, niches, etc., are often called *pediments*. These generally have the angle at the apex much more acute than the corresponding gable or gablet in Roman architecture, which, on its part, is markedly higher in proportion, or less obtuse-angled at the summit, than Hellenic pediments. See also cuts under *acrotorium*, *elastyle*, and *pedimented*.

A suborder of the arachnid order *Arthrogastra*, containing the families *Phrynidae* and *Thelyphonidae*, commonly known as *whip-scorpions*. They have eight eyes, two median and three on each side. The short chelicerae are two-jointed, while the palps are large and long, ending in more or less perfectly formed pincers. The first pair of legs is longest, and the tarsus is broken into a long series of joints. In a former system when the *Pedipalpi* also included the true scorpions, the term was synonymous with *Polineum*, and related to *Arthrogastra*. The group is now raised as an order of *Arachnida*, divided into 2 suborders, *Amphiphi* and *Uropygi*, respectively exemplified by the above named families. See also cut at *Phrynidae*.

Pelecanidae (pel'e-kan-i'dē), *n. pl.* [*NL.*, < *Pelecanus* + *-idae*.] A family of totipalmate natatorial birds, of the order *Steganopodæ*; the pelicans. The name has been used as nearly synonymous with that of the order, and variously restricted. It is now usually confined to the single genus *Pelecanus*, and includes only the pelicans. See *cut* under *pelican*.

Pelecanoides (pel'e-kā-nōi'dēz), *n.* [*NL.* (Lacépède, 1800-1), < *Gr. pelagios*, a pelican, + *-oides*, form.] A singular genus of the petrel family, *Procellariidae*, representing the subfamily *Pelecanoidinae* (or *Halodrominae*); so called from the width of the chin and distensibility of the throat, suggestive of a pelican's pouch. The bill is broad, and the nasal tubes are vertical, the nostrils opening directly upward, unlike those of any other petrel, and the wings are short, contrary also to the rule in this family. The birds live with facility, and resemble little more than petrels. Two or three species inhabit South America, as *P. urinator*. The genus is also called *Halodroma* and *Procellaria*.

Pelecanoidinae (pel'e-kan-oi-di'ni), *n. pl.* [*NL.*, < *Pelecanoides* + *-inae*.] A subfamily of *Procellariidae*, represented by the genus *Pelecanoides* alone. Also called *Halodrominae*.

Pelecanus (pel'e-kā'nus), *n.* [*NL.*, < *Lt. pelicanus*, *pelicanus*, a pelican; see *pelican*.] The

only genus of *Pelecanidae*, having the bill slender and several times as long as the head, with a hook or nail at the end, and the mandibular rami divaricated, supporting an enormous pouch. The wings are extremely long, with very numerous remiges. The tail is short, and consists of 20 or more feathers; the feet are short and stout, and all four toes are webbed. (See *cut* under *halodroma*.) The size is great, and the form is robust. The weight of the body in proportion to its bulk is reduced by its great pneumaticity. There are at least 6 perfectly distinct species, and some authors admit 9. Two inhabit the United States—the white and brown pelicans, *P. trochiliformis* and *P. fuscus*. (See *cut* under *pelican*.) The European species, inhabiting also Asia and Africa, are *P. onocrotalus* and *P. crispus*. The Australian is *P. conspicillatus*; and *P. rufescens* or *phalipensis* is found in various parts of the Old World.

Pelecinidae (pel'e-sin'i-dē), *n. pl.* [*NL.* (Haldane, 1840), < *Pelecinus* + *-idae*.] A notable family of *Hymenoptera*, represented by the genus *Pelecinus* alone. The species are supposed to be parasitic.

Pelecinus (pel'e-sin'us), *n.* [*NL.* (Latreille, 1801), < *Gr. pelecinus*, a pelican; see *pelican*.] A remarkable genus of hymenopterous insects, representing the family *Pelecinidae*. The trochanters are united; the fore wings are without complete submarginal cells; the abdomen is petiolate, very long and slender, in the female at least five times longer than the head and thorax, but shorter in the male, and clavate; the antennae are long, filamentous, not allowed, and the body is petiolate.

pelocoid (pel'e-kōid), *n.* [*< Gr. pelocoides*, like an ax, < *pelos*, an ax, a battle-ax, hatchet, + *-oides*, form.] A mathematical figure in the form of a hatchet, consisting of two acute quadrantal arcs and a semicircle. Also spelled *pelocoid*.

pelocypod (pel'e-sip'od), *n.* [*< Gr. pelocypus*, an ax, hatchet, + *-pod*, foot.] *I. n.* Having a hatchet-shaped foot; of or pertaining to the *Pelocypoda*; lamellibranchiate, as a mollusk.

II. v. A bivalve mollusk; a lamellibranch.

Pelocypoda (pel'e-sip'od-ā), *n. pl.* [*NL.*: see *pelocypod*.] The bivalve mollusks; the conchatae or accephalous bivalves, usually called *Lamellibranchiata*, *Acapha*, or *Conchifera*; so named as a class from the shape of the foot in some forms. *Goldfuss*. This name, agreeing in termination with the names of other molluscan classes, is now preferred by some conchologists to any of the prior designations.

pelocypodus (pel'e-sip'od-us), *n.* Same as *pelocypod*.

Another of our vulgar makers spoke as fittingly in this verse written to the alchemist of a rich man and his son. Then hast a useless mule (thou hast a prince's pelf), which is to be spoken of a prince's treasure, which is no respect not for any cause to be called *pelf*, though it were never so much, for *pelf* is properly the scraps of checks of tapers and shimmers, which are accounted of so little a price as they be commonly cast out of doors or otherwise bestowed upon base persons.

The character of the group is best shown by some stork, as, for example, the Indian and African piscivorous storks *Threskiornis pelagicus*, whose generic name, however, indicates a remarkable peculiarity of the tail, which is black and forked, with long white under tail-coverts projecting beyond the true tail feathers, as illustrated in the figure. They are herbs or shrubs often viscid-pubescent and odorous, sometimes fleshy, bearing opposite undivided or dimidated leaves, and flowers of scarlet, pink, white, or other colors, usually conspicuous and in umbels. Many species are cultivated for their handsome flowers or fragrant leaves, and from their strong tendency to hybridize have produced very numerous varieties; those of *P. grandiflorum*

pelican (pel'i-kan), *n.* [*Formerly also pellican, pelican; < ME. pelican, pelican, pelican, pellican, pellicane, < AS. pelican = F. pelican = Pr. pelican, pelican = Sp. Pj. pelican = It. pellicano = D. pelikan = G. Sw. Dan. pelikan, < L. pelicanus, pelicanus, < Gr. πελίκανος, also πελίκανος, πελίκανος, or πελίκανος, a pelican. (Cf. πελίκανος (πελίκανος), a woodpecker, < πελίκανος, how or shape with an ax, < πελίκανος = Skt. paraga, an ax, a battle-ax.)*] 1. A large piscivorous natatorial bird of the family *Pelecanidae* and genus *Pelecanus*, having an enormously distensible gular pouch. Pelicans of some species are found in nearly all temperate and tropical countries. Deriving their whole sustenance from the water, they frequent lakes, rivers, and sea-coasts, and generally secure their prey by wading or swimming and scooping it into their pouches; though some, as the brown pelican, swoop down on the wing, like gulls. They breed usually on the ground near water, laying from one to three eggs, white-colored, oval-ended, and of rough texture. They are gregarious, and gather in immense companies at their

breeding resorts. The birds are about as large as swans, and their short legs constrain them to an awkward waddling gait, but their flight is easy, firm, and protracted. The sexes are colored alike. The plumage is in most cases white, variously tinted with yellow and rosy hues. The American white pelican, *P. trachyrhynchus*, is five feet long and eight or nine feet in extent of wings; the general plumage is white with black primaries, and yellow lengthened plumes on the back of the head and on the breast. The bill is surmounted in the breeding season by a curious horny crest which is deciduous. (See *cut* at *rough billed*.) The brown pelican, *P. fuscus*, is of dark and varied colors, and rather smaller than the white species. The fable that the pelican wounds its own breast and feeds its young with the blood that flows from it has no foundation in fact so far as this bird is concerned. The young are fed on fish brought to the nest in the pouch, and doubtless often necerated to some extent in the gullet—a habit common to the other birds of the same order, as cormorants, gannets, etc. The myth probably arose in connection with the fabulous phoenix and may have been borne out by some facts which have been observed in the case of the flamingo (*Phoenicopterus*) possibly furthermore acquiring some plausibility, in its application to the pelican, from a red tint that is observable on the beak or plumage of some species. The pelican has from early times been considered as an emblem of charity. See *also cut* under *adipositate*.

Various forms of Pens.

1, quill pen, in which 1 is the feather, 2 the body, and 3 the nib; 2, steel pen and penholder, 3 being the handle, 4 a ferrule fitted to 2 and having a clamping socket into which the pen is inserted and their lock by means of a screw; 5, and 6, fountain pens (the body of the fountain pen is a hollow reservoir for ink, 7 is the pen holding device, and 8 is a fine metal tube passing through small holes into the ink reservoir along which the ink flows by capillary action to keep the pen supplied).

Pens of steel or gold have almost superseded the old quill pens. Pens are also manufactured to some extent of other metallic substances, such as silver, platinum, and aluminium bronze. Gold pens are usually tipped with a native alloy of osmium and iridium. They possess the advantage of being incombustible by ink, besides having a fine, quill-like flexibility and are exceedingly durable.

3. *Eccles.*, sorrow for sin shown by outward acts under authority and regulation of the church; contrition manifested by confession and satisfaction and entitling to absolution; hence, absolution ensuing upon contrition and confession with satisfaction or purpose of satisfaction. Absolution has been given on these terms since primitive times in the church, and this ancient institution was afterward formally recognized as a sacrament by the Roman Catholic, the Greek, and other churches. The sacrament of penance includes four parts: contrition, confession, satisfaction, and absolution. It is required that there should be a genuine and a supernatural contrition for the sin committed—that is, a sorrow produced by the influence of the Holy Spirit, coupled with a firm purpose of amendment; that the sin should be confessed fully and unreservedly to a priest; and that satisfaction be made for it by a voluntary submission to such penalty or discipline as the priest may require and by restitution to persons wronged; and absolution can be granted only on these conditions. It can be administered by no one who has not received priest's orders. Every member of the Roman Catholic Church is obliged at least once a year to confess to his parish priest and to do penance under his direction; he cannot partake of communion without previous absolution, but is not either before confession or during his penitential discipline regarded as under ecclesiastical censure, which is inflicted on the contumacious only.

4. The penalty or discipline imposed by the priest in the above sacrament.

A more unusual form is a garment composed of links of iron similar to chain-mail, but with the ends of the wires turned up and sharpened on the inner side. See *ascetic* and *flagellum*. — To *do penance*. (a) To repent; obsolete except in the Douay version of the Bible, and in the usage of the Roman Catholic Church.

called the *period* of oscillation of the pendulum. A *simple pendulum* is the mechanical system in a material point suspended by a weightless rod and moving without friction. A single weight attached by a string, etc., approximates to an ideal simple pendulum. The period of oscillation of a simple pendulum in vacuo is

$$= 2\pi \sqrt{\frac{l}{g}} (1 + \frac{1}{4} \frac{a^2}{l^2} + \dots)$$

where $g = 3.14159 \times g$ is the acceleration of gravity, l is the length of the pendulum, and A is the (total) arc of oscillation. The quantity in parentheses is not affected by the radical sign. It will be seen that, unless the arc is very large, the period is almost independent of its magnitude. A *compound pendulum* is any pendulum not simple. The same formula for the period applies, l being the square of the radius of gyration divided by the distance of the center of gravity from the axis of rotation. The common clock pendulum usually consists of a rod of metal or wood, suspended as to move freely about the point of suspension, and having a flat circular piece of brass or other heavy material, called a *bob*, attached to its lower end. The metal rod, however, is subject to variations in length in consequence of changes of temperature, and, as the accuracy of the pendulum considered as a regulating power depends upon its always maintaining the same length, various combinations of two different metals as brass and steel, under the name of *compensation pendulums*, have been adopted in order to counteract the effects of changes of temperature. These take particular names, according to their forms and materials, as the *griffon pendulum*, the *mercator pendulum*, the *lower pendulum*, etc. The *griffon pendulum* is composed of parallel rods of brass and steel, arranged in one plane, and so connected together that the different degrees of expansion of the different metals compensate each other and maintain the compound rod of fixed length. The *mercator pendulum*, devised by Graham, consists of one rod with a vessel containing mercury at the lower end, so adjusted in quantity that, whatever alterations take place in the length of the pendulum, the center of oscillation remains the same; the mercury ascending when the rod descends, and vice versa. Another form of compensation or compensating pendulum employs a curved bar composed of iron and brass bent together, which is attached to the rod in a horizontal position, the brass downward. The unequal expansion of the metals under a rise of temperature tends to lift the center of gravity of the bob, and thus to compensate for the simultaneous increase in length of the rod. The pendulum is of great importance as the regulating power of clocks. Our clocks are nothing more than pendulums with wheel-work attached to register the number of vibrations, and with a weight or spring having force enough to counteract retarding effects of friction and the resistance of the air. A *reversible pendulum* is a pendulum so arranged that it may be suspended from either of two axes at its length at unequal distances from the center of gravity, and so placed that in the two positions each becomes axis of suspension and axis of oscillation, so that the time of vibration shall be the same in both positions. Bessel's reversible pendulum is symmetrical in external figure with respect to the plane equidistant from the two axes. Such a pendulum eliminates the effect of the atmosphere. A pendulum which makes exactly one oscillation per second is called a *seconds pendulum* (also written *second pendulum* and *second pendulum*). The length of a pendulum is the length of the simple pendulum having the same period; that is, the distance between the point of suspension and the center of oscillation (see *center*). In the latitude of New York, and at the level of the sea, the length of the seconds pendulum is 39.1 inches nearly. As the force of gravity diminishes toward the equator and increases toward the poles, the seconds pendulum is shorter in lower latitudes and longer in higher. Besides its use as a regulator in clocks, the pendulum is applied to determine the relative and absolute acceleration of gravity at different places, and in this way the figure of the earth.

Simple Pendulum. Reversible Pendulum.

3. A chandelier or lamp *pendent* from a ceiling.—4. A guard-ring of a watch and its attachment, by which the watch is attached to a chain.—5. Axis of oscillation of a pendulum. See *axis*. **Ballistic pendulum**. See *ballistic*. **Conical pendulum**, a pendulum not restricted to move in one plane, the center of gravity being only restricted to the surface of a sphere. **Cycloidal pendulum, a pendulum so constructed as to vibrate in the arc of a cycloid instead of a circular arc like the common pendulum. The vibrations of such a pendulum are perfectly isochronous. **Electric pendulum. (*a*) See *electric*. (*b*) A pendulum that at some point of its path closes a circuit, this in turn either reporting the beats of the pendulum at distant stations for time comparisons, or directly controlling a number of clocks. See *electric clock* under *clock*.—6. **Foucault's pendulum**, a conical pendulum with a very long wire and a heavy bob, designed to exhibit the revolution of the earth. At the north pole the plane of oscillation really revolving fixed would appear to rotate about the vertical once in twenty-four hours. At the equator there would be no such effect, and at other latitudes there should be a slower rotation. See *compensation of rotation*, under *rotation*. **Gyroscopic, hydrometric, etc. pendulum**. See the adjectives. **Invariable pendulum**, a pendulum intended to be carried from station to station, and to be oscillated at each so as to determine the relative acceleration of gravity at those points. This method assumes that the pendulum is not bent nor its knife-edges altered in position or sharpness in the course of transportation. Hence it is called *invariable*, but as being incapable of change, but as being secured against change for a limited time. **Long and short pendulum**, a pendulum for determining the absolute force of gravity, consisting of a bob suspended by a wire the length of which****

F.*: origin uncertain. According to one view *cf. W. pen green*, 'white head,' the name being given to the auk in ref. to the large white spot before the eye, and subsequently transferred to a penguin. According to another view, *penguin* or *pinguin* is a corruption (in some manner left unexplained) of *E. dial. penning* or *pinning*, the pinion or outer joint of the wing of a fowl (*cf. pen*, quill, + *wing*): this name being supposed to have been given orig. to the great auk (in allusion to its rudimentary wings) and afterward transferred to the penguin.] 1. The great auk. *Alca impennis*: the original sense. — 2. Any species of the family *Spheniscidae* or *Aptenodytidae*. (See *Spheniscidae* for technical characters.) Penguins are remarkably distinguished from all other birds by the reduction of the wings to mere flippers, covered with scaly feathers (see *Imperator*, *Spheniscus*), used for swimming under water, but unfit for flight. The feathers of the upper parts have also broad flattened shafts and slight webs, being thus like scales: the feet are webbed and stout, though the hind toe is very short; the bill is short and stiff; the general form is stout and ungainly (in land the birds stand nearly erect and waddle clumsily, but they are agile and graceful in the water. They feed on fish and

other animal food, and congregate on shore to breed in penguineries of great extent. Penguins are confined to the southern hemisphere, especially about Cape Horn and the Cape of Good Hope, and islands in high southern latitudes, coming nearest the equator on the west coast of South America, as in the case of Humboldt's penguin of Peru. There are more than a dozen species, referable to three

Emptoria penguin (Emptoria penguin)

leading types. Those of the genus *Aptenodytes* are the largest, standing about three feet high, and have a slender bill. The name *Emptoria penguin* applied to these, covers two species or varieties, a larger, the emperor penguin *A. forsteri* or *imperator*, and a smaller, *A. pennantii* or *rex* (*See emperor*). *Emptoria penguin* is called from being, in medium sized or rather small, with stout bill, as *Spheniscus demigressus* of South Africa and *S. maculipennis* of Patagonia. (See *cut* at *Spheniscus*.) None of the foregoing are crested; but the members of the genus *Eudyptes* (*cf. Chelidon*), as *E. chrysomelas* or *chrysophthalmus* known as *rock hoppers* and *macarons*, have early yellow plumes on each side of the head. (See *cut* at *Eudyptes*.) Other medium sized penguins are *Pygoscelis torquata*, *P. antarctica*, *P. anglica*, and *Diomedea nigripes*. The smallest penguin, about a foot long, is *Eudyptes minor* of Australia and New Zealand shores. The largest, which was taller than a man usually is, in a fossil species named *Palaeudyptes antarcticus* from the New Zealand Tertiary. *Fapuan penguin*, a misnomer of *Pygoscelis torquata*, a penguin of the Falklands and some other islands, but not of Papua.

They record the creation, the diffusion of peoples, and the formation of the Hebrew nation and its history through the sojourn in the wilderness. Doubtless regarding the authorship of these books differ greatly. They are of Paleozoic, and especially Carboniferous, age. Very different limits have been assigned to the family. (a) By D'Orbigny, 1822, it was intended to include all the regular blastoid crinoids. In the New Testament, a Jewish harvest festival called in the Old Testament (Deut. xvi. 10, etc.) the *feast of weeks* (Hebrew *Shabuoth*), and observed on the fiftieth day after the 14th of Nisan, the date of the celebration of the Passover. The feast of Pentecost, while primarily connected with the celebration of the completion of harvest, by the offering of first fruits, etc., seems also to have been associated in the minds of the later Jews with the giving of the law on the fiftieth day after their departure from Egypt. It always precedes the Jewish New Year by 115 days.

2. The feast of Whitsunday, a festival of the Christian church, observed annually in remembrance of the descent of the Holy Ghost upon the apostles during the feast of Pentecost. Pentecost is the third of the great Christian festivals, the other two being Christmas and Easter. It is connected with its Jewish predecessor, not only historically (Acts ii. 1-11) but also intrinsically, because it is regarded as celebrating the first fruits of the Spirit, as the Jewish Pentecost celebrated the first fruits of the earth (Lev. xxiii. 17). In the primitive church the term *Pentecost* was used both for Whitsunday and for the whole period of fifty days ending with Whitsunday.

Pentecost, day of rejoicing, had come.

—*Ion* (a form expressing action or an active faculty—
"perception," "conception," "imagination," "deduc-

tione, < L. *perceptio* (n-), a receiving or collecting,
perception, comprehension, < *percepire*, pp. *per-*
ceptus, obtain, perceive; see *perceive*.] 1. Orig-
inally, and most commonly down to the middle
of the eighteenth century, cognition; thought
and sense in general, whether the faculty, the
operation, or the resulting idea. Most psychol-
ogists since Plato had made two departments of mental ac-
tion, the orotic and the speculative; the latter was called
perception, but it did not include belief founded on tes-
timony. This use of the word is now uncommon in tech-
nical language.

This experiment discovereth *perception* in plants, to move
towards that which should comfort them, though at a dis-
tance.
Bacon.

[The Hobbesians] stoutly contending that we have not
the *perception* of anything but the phantasms of material
objects, and of sensible words or marks, which we make to
stand for such objects. *Dr. H. More, Immortality of Soul*.

The two great and principal actions of the mind, . . .
perception, or thinking, and volition, or willing.
Locke, Human Understanding, II, vi, 2.

All the *perceptions* of the human mind resolve themselves
into two distinct kinds, which I shall call impressions and
ideas.
Hume, Treatise of Human Nature, I, L, 1.

2. The mental faculty, operation, or resulting
construction of the imagination, of gaining
knowledge by virtue of a real action of an ob-
ject upon the mind. It includes the first sensation,
its objectification, its location, its intuitive assimilation
of ideas already in the mind. In short, all the knowledge
that is acquired involuntarily without our being aware
of any process, and which seems to be directly given by
sense. *Perception* may be internal or external.

Perception . . . being the first step and degree toward
knowledge, and the inlet of all the materials of it.
Locke, Human Understanding, II, ix, 13.

Perception is most properly applied to the evidence we
have of external objects by our senses.
Held, Intellectual Powers, I, 1.

Perception is a complex mental act or process. More
particularly, *perception* is that process by which the mind,
after discriminating and identifying a sense-impression
(simple or complex), supplements it by an accompaniment
or escort of revived sensations, the whole aggregate of
actual and revived sensations being solidified or "in-
tegrated" into the form of a percept — that is, an apparently
immediate apprehension or cognition of an object now
present in a particular locality or region of space.
J. Sully, Outlines of Psychol., p. 102.

The manner in which the constituent elements in a *per-*
ception are combined differs materially from what is strictly
to be called the association of ideas. To realize this
difference we need only to observe first how the sight of
a suit of polished armour, for example, instantly reawakes
and steadily maintains all that we retain of former sensa-
tions of its hardness and smoothness and coldness, and
then to observe how this same sight gradually calls up
ideas now of tournaments, now of caudates, and so through
all the changing imagery of romance.
J. Ward, Encyc. Brit., XX, 87.

3. An immediate judgment founded on sense
or other real action of the object upon the mind,
more or less analogous to what takes place in
vision. Thus, we are said to recognize our friends by
perception. Also, mathematical, aesthetic, and moral judg-
ments founded on direct observation of imaginary or ideal
objects are called *perceptions*.

It is admitted on all sides that the *perception* of an ob-
ject necessarily implies the recognition of the object as
this or that, as like certain objects, and as unlike certain
other objects. Every act of *perception*, therefore, involves
classification.
J. Fish, Cosmic Philosophy, II, 107.

Her physical organization, being at once delicate and
healthy, gave her a *perception*, operating with almost the
effect of a spiritual medium, that somebody was near at
hand.
Melior, George a Dirceno, vi.

A great method is always within the *perception* of many
before it is within the grasp of one.
Dr. More.

Perhaps the quality specially needed for drawing the
right conclusion from the facts, when one has *perception*,
is best called *perception*, *delicacy of perception*.

perchloric (pér-klor'ik), *n.* [*< per- + chloric-*] Noting an acid (HClO₄), a syrupy liquid obtained by decomposing potassium perchlorate by means of sulphuric acid. It is remarkable for the great readiness with which it gives up oxygen. Brought into contact with organic matter, it is instantly decomposed, often with explosive violence. Applied to the skin, it produces a very painful wound, which is extremely slow in healing. Also *hyperchloric*.

perch-post (pérch'pöst), *n.* A crustaceous parasite of the perch.

perch-plate (pérch'plát), *n.* In a vehicle, one of the head-blocks and bed-plates which are placed above and beneath the perch, at the king-bolt.

Percidae (pér-sid-é), *n. pl.* [NL., *< Perca + -idae-*] The perch family, a group of acanthopterygian fishes, to which widely varying limits have been assigned. (a) In Bonaparte's system, same as the first family of acanthopterygian fishes in Cuvier's system (*Percoidae* in French). It included those with oblong bodies covered with scales which are generally hard or rough, with the operculum or propinquetum (or both) dentated or spinous at the edge, and the jaws and some part of the palate toothed. With such definition it included not only the modern *Percidae* proper, but also many other families. (b) In Günther's system, the representative family of his *Acanthopterygii perciformes*, having perfect ventrals, unarmored cheeks, uninterrupted lateral line, acute teeth in the jaws and on the palate, no barbels, the lower pectoral rays branched, and the vertical fin not scaly. (c) In recent American systems, *Percoidae* with an increased number of abdominal and caudal vertebrae, depressed cranium and little prominent cranial ridges, dorsal fin generally separate, and anal with one or two spinous. The species are inhabitants of fresh waters, and are represented by two genera common to North America and Europe (*Perca* and *Stizostedion*), several peculiar to the Palearctic region (*Acerina*, *Aspius*, *Percina*), and the numerous darters, constituting the subfamily *Rhynchostominae*, peculiar to North America.

It includes the families *Percidae*, *Squamipinnae*, *Mullidae*, *Sparidae*, *Sorbinidae*, and several others.

Percina (pér-sid-ná), *n. pl.* [NL., *< Perca + -ina-*] In Günther's system, the first group of *Percidae*. They have the cleft of the mouth horizontal or slightly oblique, usually two dorsals, and seldom more than two pyloric appendages. The *Percina* are mostly fresh water fishes and sea-fishes which enter rivers, and belong to the family *Percidae* and others of modern ichthyologists.

Percinæ (pér-sid-nó), *n. pl.* [NL., *< Perca + -inæ-*] A subfamily of *Percidae*, to which very different limits have been assigned. By old ichthyologists it was used for a large assemblage of genera scarcely definable by exact characters. By recent authors it has been much restricted, and, in its narrowest sense, includes the genera *Perca* and *Lucioperca* or *Stizostedion*—that is, the true perches and the pike-perches. They have the pectoral branches well developed, the preoperculum serrate, seven branchiostegals, and a large air bladder.

Amer. Soc. Psych. Research*, I. 536.

It. pericarpio = Ig. pericarpio, < NL. pericarpium, < Gr. περικαρπιον, a pod, husk, < πρι, around, + καρπε, fruit.*] In flowering plants, the seed-vessel or ripened ovary. It should accord in structure with the ovary from which it is derived, but extensive changes frequently take place during fructification by which the original ovarian form is obscured. Thus, by abortion the original number of cells in the ovary may be reduced in the fruit, as in the oak, chestnut, elm, and birch; or by the intrusion of false partitions the original number may be increased in the fruit, as in *Datura*, *Linum*, *Adragalus*, etc. The pericarp may acquire external accretions, as the wing of the maple, ash, and hop tree, the prickles on the pod of *Datura*, *Ricinus*, etc., or the barbs of the *Barbapapaver*. Connected organs may modify the ovary, such as the staminate calyx of the apple, the pappus of the *Compositae*, the persistent style of *Clematis*, the fleshy calyx of *Gaultheria*, or the fleshy receptacle of the strawberry. The walls of the ovary may change in consistence in the mature pericarp, being hard like in the pea-pod, columbine, caltha, etc., thickened and dry in nuts and capsules, fleshy or pulpy in berries, and fleshy without but indurated within, as in all stone-fruits. Where the walls of the pericarp are composed of dissimilar layers, the layers are distinguished as *sarcocarp*, *endocarp*, *epicarp*, *mesocarp*, and *puberula*. In cryptogams the pericarp is a variously modified structure containing certain organs of reproduction. Thus, in the *Characeae* it encloses the oospermia, while in the *Floridae* it encloses the entospermia. The term is also sometimes synonymous with the theca or capsule of mosses.

If the elements showing this periodic recurrence are arranged in order by themselves, they form a group which, having similar properties and relations, follows a regular progression in the individual differences of its members. — **Periodic stars.** See *star*. — **Periodic winds.** See *monsoon* and *trade wind*.

Several periotic bones are found in nearly all vertebrates. They may all remain distinct throughout life, but they are usually more or less confluent with one another, and may be, as in man, completely fused; furthermore, they may ankylose with other cranial bones, and thus give rise to certain parts of the compound temporal bone. The parts of a skull called mandible are commonly outgrowths of periotic bone. The set of periotic bones composes a bony case for the inner ear, much as the case of a watch covers the works, and this is termed the *otocranium*, *otic capsule*, or *shell of the ear*. When mandible parts are added, the remaining bone is called *petromatoid*. The human periotic bones form what are called the *petrous* and *ossified* portions of the temporal bone. Periotic bones which have been distinguished and named in various animals are the *epiotic*, *prootic*, *opiotic*, and *parotic*. See these words, and cut under *hypoid*. - *Periotic fenestra*, a cavity or depression included by the cranial bones superior nuchal canal, in the fetus or infant.

periscope (pe-rif-skōp, n. [*Gr.* *περίσκοπεῖν*, look around, (*περί*, around, + *σκοπεῖν*, look.)]

1. A general view or comprehensive summary. [*Rare*.] — 2. An instrument by which objects in a horizontal view may be seen through a vertical tube. It is used in piloting submarine boats, and consists substantially of a vertical tube with a lenticular total reflection prism at the top, by which horizontal rays are projected downward through the tube, and brought to a focus, after which they are received by a lens the principal focus of which coincides with that point. The vertical cylindrical beam thus formed is converted into a horizontal one again by a mirror inclined at 45° from the vertical axis of the tube, and is thus conveyed to an eyepiece, through which, by turning the tube on its vertical axis with its attached prism, a view of all the supernatant objects around the vessel may be obtained. A screen or diaphragm operated by a tangent-screw is used to cut off the view of the vertical plane in which the sun is.

Specifically — (a) Noting spectacles or eye-glasses having meniscus or concavo-convex lenses, and thus giving a wide field of vision, also other wide-angled lenses. (b) Noting a peculiar form of microscope-lens, composed of two deep plano-convex lenses ground to the same radius, and having between their plane surfaces a thin plate of meta' pierced with a circular aperture of a diameter equal to one fifth of the focal length of the combination.

periscopical (pe-rif-skōp-ik-al, a. [*Gr.* *περίσκοπικός* + *-al*].) Same as *periscopic*.

periscopism (pe-rif-skōp-izm, n. [*Gr.* *περίσκοπος* + *-ism*].) The faculty of periscopic vision. See the extract.

It is probable that the peculiar structure of the crystalline lens . . . confers on the eye the capacity of seeing distinctly over a wide field, without changing the position of the point of sight. This capacity he [Dr. Hermann] calls *periscopism*.

hoofed quadrupeds; distinguished from *Artiodactyla*. The digits are unpaired or unequal, the third being the largest and sometimes the only functional one; and they are corresponding modifications of the metacarpal and metatarsal and of the carpal and tarsal bones and their articulations. The hind feet are always odd-toed and though the fore feet may have 4 digits, as in the tapir, these are unpaired. The astragalus has two very unequal facets or articular surfaces on the under side. The femur has a third trochanter. The dorsolumbar vertebrae are no fewer than 22 in number. The intermaxillary bones are toothlike above and united toward the symphysis, and their incisors, when present, are implanted nearly vertically and are nearly parallel to their roots. The stomach is simple and non-ruminant; there is a capacious accumulated cecum. In all the living forms horns, when present, are single and median, or two, one behind the other. The only living representatives of the suborder are the tapirs, rhinoceroses, and horses, including asses, zebras, etc., of the three families *Tapiridae*, *Rhinocerotidae*, and *Equidae*. The fossil families are more numerous, including the *Ancitheriidae*, *Palaeotheriidae*, and *Lophodactylidae*. Also *Perissodactyl*. See also cut under *Solidungulate*.

Permian (pér-mi-an), *a.* and *n.* [*< Ml. *Per-mianus, < Permia, Perm (see def. 1).*] *I. a.* 1. Relating to the city or government of Perm in eastern Russia. — 2. Relating to the Permian. — 3. An epithet applied by Murchison and his coadjutors in a geological reconnaissance of a part of Russia, in 1841, to a group of strata overlying the Carboniferous, and forming the uppermost division of the Paleozoic series. The rocks of which the Permian system is composed are largely red sandstone, and their equivalent in England had then been known as the *New Red Sandstone*, to distinguish it from the *Old Red Sandstone*, which lies beneath the Carboniferous. Eventually the New Red of England was found to be divisible (palaeontologically) into two groups, of which the older was classed with the Paleozoic, and the newer placed in the Mesozoic. In Germany there is a well marked division of the Permian into two lithologically distinct groups; hence it is sometimes designated as the *Dyas*, a name coined in imitation of *Trias*. The divisions of the Permian in Germany are a lower series of sandstones, red and mottled in color (hence the name *Perithia* has been applied to them), called the *Rotliegendes*, and an upper series of dolomites, marls, limestones, etc., called the *Zechstein*. The flora of the Permian in general closely resembles that of the Carboniferous, and several of the most characteristic plants of the latter pass upward into the Permian, but rise no higher. The cycads appear first in the Permian, and are largely increased in number and importance in the *Trias*. The Permian fauna is, on the whole, less rich than those of the overlying and underlying groups. The Permian has of great economical importance in Europe, as the repository of extensive deposits of rock-salt, gypsum, and other saline combinations.

3. In *math.*, a linear arrangement of objects resulting from a change of their order. *Permutation* differs from *combination* in this, that in the latter there is no reference to the order in which the quantities are combined, whereas in the former this order is considered, and consequently the number of permutations always exceeds the number of combinations. If *n* represents the number of quantities, then the number of permutations that can be formed out of them, taking two by two together, is $n \times (n - 1)$; taken three and three together, it is $n \times (n - 1) \times (n - 2)$, and so on. Sometimes called *alternation*. See *combination*, 5.

3. In law: (a) A limitation intended to be unalterable and of indefinite duration; a disposition of property which attempts to make it inalienable beyond certain limits fixed or conceived as being fixed by the general law. Pollock. The evils incident to rendering any specific piece of land or fund inalienable, and thus shutting it out from the general circulation of property, early led the courts to hold provisions for a perpetual suspension of the power of alienation to be void. The desire of owners of estates to perpetuate the wealth of the family led to attempts to create forfeitures and gifts over to other persons, by way of shielding the successor in the title from temptation to alienate; and as the right to create life-estates and trusts, and to add gifts over to other persons upon the termination of precedent estates, could not be wholly denied, the question has been what temporary suspension of the power of alienation is reasonable and allowable, and what is too remote and to be held void as "tending to create a perpetuity." (See *reversion*.) The limit now generally established for this purpose in varying forms is substantially to the effect that no disposition of real property or creation of an estate therein is valid if it suspends the absolute power of alienation for more than a period measured by a life or lives in being plus 21 years and 9 months. Hence, since liberal perpetuities are no longer known, except in the law of charities, etc., the phrase *rule against perpetuities* has come to mean in ordinary usage the rule against future estates which are void for remoteness as "tending to create a perpetuity." (b) Duration to all futurity; exemption from intermission or ceasing. — 4. In the doctrine of annuities, the number of years in which the simple interest of any principal sum will amount to the same as the principal itself; or the number of years' purchase to be given for an annuity which is to continue forever; also, the annuity itself. — In *perpetuity*, for an endless or an indefinite length of time; forever.

persistence (pér-sis'tens), n. [Also *persistence*; < *F. persistance* = *Sp. Pg. persistencia* = *It. per-*

astenza, < ML. *persistencia*, < L. *persisten* (-t-), *persistens*: see *persist*.] 1. The quality of being persistent; steady or firm adherence to or continuance in a state, course of action, or pursuit that has been entered upon; especially (of persons), a more or less obstinate perseverance; perseverance notwithstanding opposition, warning, remonstrance, etc.—2. The continuance of an effect after the cause which first gave rise to it is removed: as, the *persistence* of the impression of light on the retina after the luminous object is withdrawn; the *persistence* of force. — **Persistence of force**, the law of mechanics. The phrase was introduced by Herbert Spencer to sum up all the laws of mechanics, especially the two principles of the permanence of matter and the conservation of energy. The law of action and reaction may be considered as consisting in the persistence of the algebraic sum of the moments, and in fact every such law may be stated in an integrated form which contains an arbitrary constant independent of the time. — **Persistence of vision**, the continuance of a visual impression upon the retina of the eye after the exciting cause is removed. The length of time varies with the intensity of the light and the excitability of the retina, and ordinarily is brief, though the duration may be for hours or even days. The after-image may be either positive or negative, the latter when the bright parts appear dark and the colored parts in their corresponding contrast-colors. It is because of this persistence that, for example, a firebrand moved very rapidly appears as a line or circle of light. The phenakistoscope, zoetrope, and other similar contrivances depend for their effect upon this principle. — **Syn.** 1. *Industry, Application*, etc. (see *assiduity*), pertinacity, doggedness.

3. The art of representing solid objects on a flat surface so that when they are viewed the eye is affected in the same manner as it would be by viewing the objects themselves from a given point. By *perspective*, in common language, is meant *linear perspective*, or the art of delineating the outlines of objects of their shadows, and of their reflections. The theory is that the positions of the delineated points in the picture are such that if rays, or straight lines, were drawn from the corresponding original points in the natural objects to the eye of the spectator, and if the picture were then interposed in the right position, it would be pierced by these rays at the points of delineation. It follows that perspective supposes that a picture is to be looked at with one eye placed in a particular position; and if it be otherwise looked at, the perspective necessarily appears false. This position of the eye, called the station-

JSCE, an original plane; *JSCE*, another original plane; *CE*, their intersection, an original line; *ABD*, plane of delineation; *E*, station point; *EFBN*, directing plane; *FAPN*, vanishing plane of original plane *JSCE*; *AC*, in intersecting line; *AD*, its vanishing line; *BC*, its directing line; *BD*, its vanishing line of original plane *JSCE*; *DE*, its directing line; *BE*, its vanishing line; *HE*, its directing line; *C*, intersecting point of line *CE*; *A*, its vanishing point; *B*, its directing point; *D*, its directing point; *AC*, its delineation.

point, or point of sight (which phrase with old writers has, however, another meaning), is, according to the directions of most treatises, placed much too near the picture to represent the mean position of a person looking at it. Ar-

this consequently and it necessary to modify the forms which strict perspective would prescribe. To ascertain how an original line or plane (that is, a line or plane in nature) is to be delineated, we have to consider, first, the *vanishing point* or *line*, also called the *intersection of the original line or plane* (that is, the point or line where the original line or plane, extended if necessary, cuts the plane of delineation, or the plane of the picture, extended to infinity); and, second, the *vanishing point* of the original line, or the *vanishing line* of the original plane (that is, the point or line where the plane of delineation is cut by a line or plane passing through the eye parallel to the original line or plane). An original line is represented by some portion of the line from its intersecting point to its vanishing point; and every line in a given original plane has its intersecting point on the intersecting line and its vanishing point on the vanishing line of that plane. It is also proper to consider the *directing plane*, or plane through the eye parallel to the picture, the *directing line*, or line in which the directing plane cuts an original plane; the *directing point*, or point in which the directing plane is pierced by an original line; and the *director* or line from the eye to a directing point. It is further necessary to take account of the *direct radial*, or *principal radial line*, being the perpendicular let fall from the eye upon the plane of delineation; the *center of the picture*, or *center of vision* (called by old writers the *point of sight*), being the foot of that perpendicular; and the *principal distance*, or *distance of the picture*, being the perpendicular distance of the plane of delineation from the eye. The *ground-plane* is the level plane on which the spectator is supposed to stand. The *horizontal line*, or *horizon*, is the line in which the level plane through the eye cuts the picture, passing ordinarily through the center. This would better be termed the *horizontal line at infinity*, for, owing to the dip of the horizon (which see, under *dip*), it differs sensibly from the delineation of the true horizon. Linear perspective is merely a branch of descriptive geometry, itself an application of projective geometry. Perspective is intimately connected with the arts of design, and is particularly necessary in the art of painting, as without a correct observance of perspective no picture can have truth. Perspective is illustrated in the correct delineation of even the simplest positions of objects.

4. A drawing or representation in perspective; specifically, a painting so placed at the end of an alley, or garden, or the like, as to present the appearance of continuing it, and thus produce the impression of greater length or extent. Stage scenic painting is of this nature.

See *gauche*. — **In perspective**, according to the laws of perspective; hence, represented on a flat surface in such a way as to convey the idea of solidity and distance.

Inverse perspective, the art of interpreting pictures in perspective so as to ascertain the proper position of the eye and the relative positions and forms of the objects represented. — **Isometric perspective**. See *isometric*. — **Linear perspective**. See *linear*. — **Oblique perspective**. 4. In *astron.*, a deviation of the motion of a planet or comet from a fixed orbit or from its regular velocity in that orbit. Perturbations are caused by the gravitating action of bodies other than the primary or central body. They are commonly and somewhat incorrectly conceived, not as drawing the planets out of their orbits, but as causing by gradual changes of the elements of the orbits themselves. All perturbations due to gravitation are, strictly speaking, periodical. But

some of them, which depend upon the relative situation of the orbits of different planets, go through their changes in such vast intervals of time that they are more conveniently regarded as progressive and not periodic, and are termed *secular perturbations*; while others, depending for the most part upon the relative situation of the planets in their orbits, go through their changes in comparatively short intervals of time, and can only be represented as periodic and these are technically called the *periodic inequalities*. = *Syn. 1.* Agitation, trepidation, uneasiness, worry, discomposure.

perturbatory (pér-tér-bá-tó-ri), *n.* [*< perturbare + -ory.*] A name once used by real and pretended believers in the divining-rod to indicate a hypothetical power assumed to reside in certain individuals whereby they can exert a perturbing influence upon the motion of a swinging pendulum, etc. Its characteristics were an expansive quality, residing most abundantly in the thumb and forefinger, whereby the center of gravity of a pendulum held by these digits could be caused to describe a circle, and a compressive quality, belonging to the middle finger, which it resists such motion. A man with a high compressive or "active" *perturbatory*, touching with his middle finger the hand of another with the expansive *perturbatory* well developed in thumb and forefinger, might neutralize the *perturbatory* in the latter, which is of the "passive" variety. A person equally endowed with these *perturbatories* would be negative, and so forth.

The study of rocks; lithology; petrology. The investigation of the minerals of which rocks are made up is called *lithology*, which includes not only the determination of the mineral constituents of a rock, but also the study of the changes which these constituent minerals have undergone, either during the consolidation of the rock or at a subsequent period, in the course of those changes which are denominated *metamorphic* (see *metamorphism*) changes often complicated and difficult to decipher. While in some rocks the constituents are crystallized in large and distinctly formed individuals, so that each species can be separated and analyzed by itself without difficulty, this is ordinarily not the case. Hence by the methods formerly pursued it was often extremely difficult, if not impossible, to make out clearly of what species the rock was composed. At the present time the method of examination of a rock consists in cutting from it one or more sections sufficiently thin to be nearly transparent; these are examined with the microscope, with and without the use of polarized light; and the optical and crystallographic appearances presented are generally sufficient to give not only a correct idea of the nature of the minerals, but also of the changes which they have undergone through various stages of metamorphism. Assistance is also afforded by the method of separation in which gravity solutions are employed. (See *gravity solution*.) While most geologists writing in English use the terms *lithology*, *petrology*, and *petrography* as nearly synonymous, others desire to limit the meaning of the first of these to the indoor or laboratory study of rocks, and would define *petrography* as including their investigation both indoors and in the field.

Petrography I define as that branch of sciences which embraces both lithology and petrology. It includes every thing that pertains to the origin, formation, occurrence, alteration, history, relations, structure, and classification of rocks as such. It is the essential union of field and laboratory study. *M. E. Wadsworth, Lithological Studies, p. 2.*

When purified and decolorized, it forms a silvery neutral mass, yellow or reddish in color, odorless, tasteless, and somewhat fluorescent. It is used as a basis for ointments and as a protective dressing. Also called *vaseline* and *cosmetine*.

Sw. petroleum* (MD. *petroleo*), *< ML. petroleum* (also *petroleum, petrelion*, *< MGr. Ντρε, τρεπέλαιον*), rock-oil, *< L. petra* (*< Gr. πέτρα*), rock, + *oleum* (*< Gr. ἔλαιον*), oil; see *oil*. A ML. adj. *petroleus*, pertaining to rocks (neut. *petroleum, or oleum petroleum, rock-oil*), is given.] An oily substance of great economical importance, especially as a source of light, occurring naturally oozing from crevices in rocks, or floating on the surface of water, and also obtained in very large quantity in various parts of the world by boring into the rock; rock-oil. Petroleum was known to the Persians, Greeks, and Romans under the name of *naphtha*; the less liquid varieties were called *asphaltos* by the Greeks, and *bitumen* was with the Romans a generic name for all the naturally occurring hydrocarbons which are now included under the names of *naphthum, maltha*, and *petroleum*. The last name was not in use in classic times. The existence of petroleum in Pennsylvania and New York has been known from almost the earliest time of the settlement of those States by Europeans, but it was not until 1859, when oil was obtained by boring at Titusville on Oil Creek, a branch of the Allegheny River, that it began to be of commercial importance. At the present time (1902) the production of crude

petroleum is more than sixty million barrels a year, and the value of the exports of this article in various forms amounts to about \$70,000,000 a year, most of the material exported being furnished by the oil-fields of Ohio and Indiana. The crude oil undergoes refining, and is put upon the market in various forms (see *kerosene, naphtha, kerosene*, etc.), but much the largest part of this product has the form of an oil suitable for burning in lamps in all parts of the world. The only other oil-producing region in the world at all comparing with those of the United States is at and near Baku, on the Caspian, where the existence of oil has been known from time immemorial, but where its commercial importance has only recently been realized. The exported petroleum of the United States are chiefly from rocks of Devonian age; those of Baku occur in the Tertiary. An important part of the transportation of the crude material in the United States is effected by pipes laid beneath the surface, through which the oil is forced. See *pipe-line*. Also called *coal-oil, earth-oil*.

See *Fourierism*.

phalanx (fā'langks or fal'angks), *n.*; *pl.* *phalanxes* (fā-lan'jās) or (except in anatomy) *phalanxes* (fā'langk-sēz or fal'angk-sēz). [= *F.* *phalanx* = *phalanx*; see *phalanx*.] 1. *Sp. It.* *falanga*, < *L. phalanx* (*phalang-*), < (Gr. *phalanx* (*phalang-*), a line or order of battle, a rank of soldiers, a phalanx (def. 1), also a round piece of wood, the bone between joints of the fingers and toes, etc.) 1. In *Gr. antiqu.*, in general, the whole of the heavy-armed infantry of an army; particularly, a single grand division of that class of troops when formed in ranks and files close and deep, with their shields joined and long spears overlapping one another so as to present a firm and serrated front to a foe. The celebrated Macedonian phalanx was normally drawn up sixteen ranks deep, the men being clad in armor, bearing shields, and armed with spears and with pikes from 21 to 24 feet long. In array the shields formed a continuous bulwark, and the ranks were placed at such intervals that five spears which were borne pointed forward and upward protected every man in the front rank. The phalanx on smooth ground, and with its flanks and rear adequately protected, was practically invincible; but it was cumbersome and slow in movement, and if once broken could only with great difficulty be reformed.

2. Any body of troops or men formed in close array, or any combination of people distinguished for firmness and solidity of union.—3. In Fourier's plan for the reorganization of society, a group of persons, numbering about 1,800, living together and holding their property in common. See *Fourierism*.—4. In *anat.* and *zool.*: (a) A row or series of bones in the fingers or toes. Hence—(b) One of the bones of the fingers or toes; a digital internode, succeeding the metacarpal or metatarsal bones, collectively constituting the skeleton of the third and distal segment of the hand or foot; so called from their regular disposition in several rows. The normal number of the phalanges of each digit is three. This is only exceptionally increased, as in the flippers of some cetaceans and extinct reptiles; but it is frequently reduced, as in most of the digits of birds, and in the inner digits of mammals which have five fingers and toes. In man the phalanges of the fingers and toes are each fourteen, three to every digit excepting the thumb and great toe, which have two apices. The original implication of the term seems to have been any one of the cross-rows of small bones between the successive knuckles of the fingers or toes, or the longitudinal series of small bones of any one finger or toe. But usage transfers the sense of *phalanx* to any one of these bones, two or more of which are *phalanges*. See cuts under *Artiodactyla*, *Carpus*, *Cervulina*, *Foot*, *Hand*, *Ichthyomyia*, *Perimyscus*, *Pinion*, *Phascogaster*, *Subunguicula*, *Tarsus*, and *Ornithomyia*. In *zool.*, a group or series of animals, of indeterminate classificatory value; one of several groups which may be interposed above genera and below classes or orders. A phalanx frequently corresponds in value to a subfamily, but has no recognized fixed place in classification. Sometimes synonymous with *cohort* or *agmen*.—6. *Basilar phalanx*, a phalanx of the proximal row.—7. *Middle phalanx*, a phalanx of the middle row.—8. *Ungual phalanx*, the terminal phalanx, on which is the nail.

There are 3 species, usually placed in as many genera, of elegant and varied coloration, and in general resembling sandpipers; but the body is depressed rather than compressed, and the plumage of the under parts is thick and compact to resist water, upon which these little birds swim with great ease and grace. They are found on inland waters and along the coasts of most parts of the world, sometimes venturing far out to sea. Two of the three species breed only in boreal regions, and perform extensive migrations in the spring and fall. Wilson's phalarope, *Phalaropus (Steganopus) Wilsoni*, the largest and handsomest species, is confined to America, breeding from northern parts of the United States northward, and dispersing in winter over South America. It is 2½ inches long, and 1½ in extent of wings; the bill is 1½ inches long and extremely slender; the margins of the toes are not scalloped. The female exceeds the male in size and beauty, and the male performs the task of incubation. The red-necked or northern phalarope is *Phalaropus (Lobipes) hyperboreus*; this has a slender bill like the first, but is smaller, and the membrane

olent Jewish sect, or party which was especially noted for its interpretation and observance of the law, both canonical and traditional. It is possible the Pharisees held to the resurrection of the body, and the immortality of angels and spirits, the providence and dominion of God, the immortality and authority of Scripture, and the authority of ecclesiastical tradition; possibly they were intensely Jewish, though not constituting a distinct political party; possibly they were scrupulous in the observance of the strictest observance of the law, both written and oral. The Pharisees anticipated John Hyrcanus I. (134-104 B. C.), and the Sadducees reformers bitterly opposed the corruption of the law, and returned Judaism from the pagan religions which had been called Superstition by their opponents. In the Pharisees the authority of the law, and to provide for questions which it did not directly answer, they derived the force of an oral tradition, etc. to be held in reverence.

For the more glory of God that these things were done,
the more the Pharisees were first with curses against Jesus.
